

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) A method for managing use of a software code by a selected application program, comprising:
configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is not the software code used by the selected application program;
detecting the use of the software code;
identifying the selected application program that is using the software code; and
confirming a conflict between the selected application program and the software code.
2. (Canceled)
3. (Previously Presented) The method of claim 1, wherein configuring the database further includes:
obtaining information relating to at least one of the plurality of application programs and corresponding at least one designated software code in a non-automated fashion.
4. (Previously Presented) The method of claim 1, wherein at least one of the plurality of application programs is associated with an executable code, and wherein configuring the database further includes:
obtaining information relating to the at least one of the plurality of application programs and the corresponding at least one designated software code by automated examination of the executable code; and
entering the information into the database.

5. (Previously Presented) The method of claim 1, wherein configuring the database further includes:
entering information relating to the at least one of the plurality of application programs
and the corresponding at least one designated software code by using a snapshot
of installation activity required for the at least one of the plurality of application
programs.
6. (Previously Presented) The method of claim 1, wherein at least one of the plurality of
applications programs is associated with a system resident installation package, and
wherein configuring the database further includes:
entering information relating to the at least one of the plurality of application programs
and the corresponding at least one designated software code by automated
examination of the system resident installation package.
7. (Previously Presented) The method of claim 1, wherein confirming a conflict between the
software code and the selected application program further includes:
determining that the software code is not the same as the corresponding at least one
designated software code.
8. (Original) The method of claim 7, wherein the corresponding at least one designated
software code has a version number which differs from a version number associated with
the software code used by the selected application program, and wherein determining that
the improper software code is not the same as the corresponding at least one designated
software code further includes:
determining the version number of the corresponding at least one designated software
code and the version number of the software code used by the selected application
program; and
comparing the version number of the corresponding at least one designated software code
to the version number of the software code used by the selected application
program.

9. (Original) The method of claim 1, wherein the software code is a software library, and wherein detecting use of the software code further includes:
enabling detection of a library loading operation.
10. (Original) The method of claim 9, wherein enabling detection of a library loading operation further includes:
setting a software hook activated by the library loading operation.
11. (Original) The method of claim 1, further including:
configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is the same as the software code used by the selected application program.
12. (Original) The method of claim 1, wherein identifying the selected application program further includes:
determining a file name of the selected application program.
13. (Original) The method of claim 1, wherein the selected application program has an application version number, and wherein identifying the selected application program further includes:
determining the application version number.
14. (Original) The method of claim 1, further including:
reporting the conflict; and
alerting a selected party regarding the conflict.
15. (Original) The method of claim 14, wherein the selected party is an end user of the selected application program.

16. (Original) The method of claim 1, further including:
reporting the conflict; and
activating an alarm.
17. (Previously Presented) A computer workstation, comprising:
a processor module; and
a machine-accessible medium communicatively coupled to the processor module, the machine-accessible medium having instructions associated therewith for managing use of a software code by a selected application program, which when executed are capable of causing the processor module to perform:
configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is not the software code used by the selected application program;
detecting the use of the software code;
identifying the selected application program that is using the software code; and
confirming a conflict between the software code and the selected application program.
18. (Canceled)
19. (Previously Presented) The computer workstation of claim 17, wherein at least one of the plurality of application programs is associated with an executable code, and wherein configuring the database further includes:
obtaining information relating to the at least one of the plurality of application programs and the corresponding at least one designated software code by automated examination of the executable code; and
entering the information into the database.

20. (Previously Presented) The computer workstation of claim 17, wherein confirming a conflict between the software code and the selected application program further includes: determining that the software code used by the selected application program is not the same as the corresponding at least one designated software code.
21. (Original) The computer workstation of claim 20, wherein the corresponding at least one designated software code has a version number which differs from a version number associated with the software code used by the selected application program, and wherein determining that the software code used by the selected application program is not the same as the corresponding at least one designated software code further includes: determining the version number of the corresponding at least one designated software code and the version number of the software code used by the selected application program; and comparing the version number of the corresponding at least one designated software code to the version number of the software code used by the selected application program.
22. (Original) The computer workstation of claim 17, wherein the software code is a software library, and wherein detecting use of the software code further includes: enabling detection of a library loading operation.
23. (Original) The computer workstation of claim 22, wherein enabling detection of a library loading operation further includes: setting a software hook activated by the library loading operation.
24. (Original) The computer workstation of claim 17, further including: configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application

program, and wherein the corresponding at least one designated software code is the same as the software code used by the selected application program.

25. (Previously Presented) A computer system network, comprising:

a server comprising:

a processor module;

a machine-accessible medium communicatively coupled to the processor module,

the machine-accessible medium having instructions associated therewith for managing use of a software code by a selected application program, which when executed are capable of causing the processor module to perform:

configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is not the software code used by the selected application program;

detecting the use of the software code;

identifying the selected application program that is using the software code; and

confirming a conflict between the software code and the selected application program; and

a client communicatively coupled to the server, wherein execution of the selected application program is initiated by the client.

26. (Canceled)

27. (Previously Presented) The computer system network of claim 25, wherein at least one of the plurality of application programs is associated with an executable code, and wherein configuring the database further includes:

obtaining information relating to the at least one of the plurality of application programs
and the corresponding at least one designated software code by automated
examination of the executable code; and
entering the information into the database.

28. (Previously Presented) The computer system network of claim 25, wherein the database is stored on the server.
29. (Original) The computer system network of claim 25, wherein confirming a conflict between the software code and the selected application program further includes:
determining that the software code is not the same as the corresponding at least one designated software code.
30. (Original) The computer system network of claim 25, further including:
configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is the same as the software code used by the selected application program.
31. (Previously Presented) A machine-accessible medium having instructions associated therewith for managing use of a software code by a selected application program, which when executed are capable of causing a processor module to perform:
configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is not the software code used by the selected application program;
detecting the use of the software code;
identifying the selected application program that is using the software code; and

confirming a conflict between the improper software code and the selected application program.

32. (Canceled)
33. (Previously Presented) The machine-accessible medium of claim 31, wherein at least one of the plurality of application programs is associated with an executable code, and wherein configuring the database further includes:
obtaining information relating to the at least one of the plurality of application programs and the corresponding at least one designated software code by automated examination of the executable code; and
entering the information into the database.
34. (Original) The machine-accessible medium of claim 31, wherein confirming a conflict between the software code and the selected application program further includes:
determining that the software code used by the selected application program is not the same as the corresponding at least one designated software code.
35. (Original) The machine-accessible medium of claim 34, wherein the corresponding at least one designated software code has a version number which differs from a version number associated with the software code used by the selected application program, and wherein determining that the software code used by the selected application program is not the same as the corresponding at least one designated software code further includes:
determining the version number of the proper software code and the version number of the improper software code; and
comparing the version number of the corresponding at least one designated software code to the version number of the software code used by the selected application program.
36. (Original) The machine-accessible medium of claim 31, wherein the software code is a software library, and wherein detecting use of the software code further includes:

enabling detection of a library loading operation.

37. (Original) The machine-accessible medium of claim 31, having instructions associated therewith which when executed are capable of causing the processor module to further perform:

configuring a database having a plurality of application programs, wherein each one of the plurality of application programs corresponds to at least one designated software code, wherein the plurality of application programs includes the selected application program, and wherein the corresponding at least one designated software code is the same as the software code used by the selected application program.
